by Ir. Noorfaizah binti Hamzah Women Engineer Section

COVER — NOTE

Engineering A Resilient Future

n recognition of International Women's Day on 8 March, the Women Engineers Section of IEM takes centrestage in this month's JURUTERA, which highlights topics that affect not just women engineers, but also all engineers.

Despite our lives being severely affected by the Covid19 pandemic and the unfortunate

event of recent floods, Malaysians have shown we have the capacity to adjust to the circumstances with our technical competencies to adapt and the capacity to innovate so as to be able to overcome these adversities.

Both scientific and social science knowledge are topics of debate in many organisations, in terms how much damage is acceptable during an extreme event. This is where engineering resilience is heavily related to scientific countermeasures. When engineers nurture a resilient future, we embrace details of safety and the application of scientific knowledge to enhance our lifestyles to our mental health and build talent in the future generations.

As engineers anticipate complexities and adversities, having a resilient mindset overcomes all these to let us look towards the future, from broken, damaged machine parts to overwhelmed workers in industry and increasing market pressure.

EDITOR'S NOTE –

Focus On Resilience

n the movie *Apollo* 13, one of the most famous quotes is "Failure is not an option". However, in real life, failure is sometimes inevitable since there is always the possibility of things not going as planned, especially with growing systems complexity and dependency on third-party vendors. This is where resiliency, the act of bouncing back to solve the situation, comes into action.

by Ir. Prof. Dr Zuhaina binti Zakaria Principal Bulletin Editor

This month, *JURUTERA* focuses on resilience which, either way, is required in engineering processes as well as is one of the critical skills for all engineers. With a resilient mindset, we can learn from mistakes and move forward. This will help us build up our inner strength and boost confidence in our life.

On behalf of the Editorial Board, I hope that you will enjoy reading this issue and please stay safe and healthy during this Omicron wave.

ENGINEERING A RESILIENT FUTURE

Written and Prepared by: Ir. Assoc. Prof. Dr Zahiraniza binti Mustaffa Ir. Mah Siew Kien Ms. Michelle Lau Ms. Choong Pooi Ying

hat is resilient? According to the Cambridge Dictionary, resilient is defined as "able to improve quickly after being hurt or being ill" or "able to return guickly to a previous good condition after problems". Depending on the context, the word resilient can have different interpretations and yet be appropriate to the subject.

Engineering, one of the oldest and most noble professions in the world, is still highly relevant and humanity continues to depend on it every day. Without engineers bringing to life the various technologically advances and innovative solutions, we will not see progress and lifesaving innovations which have contributed to and are still contributing in the fight against Covid-19. These include improvised ventilators, testing booths and robots that assisted Covid patients.

On a more basic note, engineers working in the utilities sector ensure the nation is supplied with electricity, clean water, telecommunication services, logistics and the ever-important medical equipment, enabling all of us to stay safe at home and in comfort.

For the last 2 years, the Covid-19 pandemic almost brought the world to a standstill. It affected countless individuals, businesses and organisations. Due to the sudden negative socioeconomic effect worldwide, businesses and organisations experienced a sudden downfall in income, causing them to operate as lean as possible. Globally, this has resulted in downsizing and retrenchment. Many individuals lost their jobs (and thus their source of income) and some even lost their sense of self-worth.

Because of the lack of physical contact and engagements, families and loved ones were not able to meet for extended periods and this caused emotional distance and relationship despair; students could not attend physical classes and colleagues could not discuss work matters in the meeting room. The new norm forced us to stare at the computer screen more than ever, removing the human touch in communication.

Is there a way to mitigate these new norm problems? All individuals, businesses and organisations should engineer a resilient future. Why? This is to ensure they will be able to face the post-pandemic era with a sense of control, problem solving abilities, strong social connections and, more importantly, survival mentality. Resilient individuals are aware of situations, their own emotions and the behaviour of people around them. They will grow stronger in the face of adversity. In the context of a business or organisation, being resilient means the company will be able to endure any economic downfall and be agile in adapting to new business management models that will benefit everyone, from motivating employees in ways they can contribute and providing job security to innovation and new processes to stay afloat and sustainable.

In this article, we will look at the viewpoints of three different individuals in the context of Engineering a Resilient Future.

Unboxing the Key to a Resilient Future

Trust management is the key to a resilient future. It revolves around who to trust and what to trust and both must coexist. Why is trust management so important? It is the process in which both employer and employee have a strong and steadfast relationship built on trustworthiness and this enables both parties to work together comfortably and confidently towards common goals.

The nature of trust in an organisation stems from an individual's personality traits and it ties in with an individual's attributes, which comprise integrity, responsibility and accountability. Human resource has always preached about the importance of having an allrounded and diverse team as a combination of different individuals will encourage and empower teams to be open minded and to adopt to changes. By understanding and leveraging on the psycho-sociometry of individuals involved in its operations, a business or organisation can fully unleash the true potential and passion of its employees while ensuring the best for the organisation at the same time.

Dr Rahmat Shazi, Technoloav Director of ShazInnovation Solution, says: "One thing about engineering is that it creates value, not only for those who benefit from the output, but also the people executing the deliverables that bring the said value. It is a discipline that refines one's cognitive skills, develops relational skills needed to extract value from ideas and, of course, creates a society that can take that idea further. Alas, the latter can only be built if relational skills are based on benevolent objectives and integrity. And therein lies the deficit today. Do engineers of today and the future understand that they need to empathise with end users of their deliverables?"

Be it engineers or anyone else, we all need to be open minded and to be able to accept criticism and to reflect on the criticism. At the same time, managers need to be able to put aside their egoistic personality and accept that they are not always right, just because they are older in age or have seniority.

To develop a resilient culture, everyone should adopt an open-minded approach and embrace the differences of each individual team member in order to cultivate a strong team. This dynamics and provides psychological safety in the team and members can share their true emotions without being judged or be labelled weak. In the end, everyone involved benefits as all will be open enough to share their plans and thoughts without fear.

It cannot be denied that the Maslow's hierarchy of needs is also an imperative factor in talent retainment. To retain talent in an organisation, employees should be adequately compensated and a platform provided for them to unleash their potential. We must realise that the new generation workforce today demands better work-life balance, reasonable standards of living and opportunities to develop themselves. But life is a two-way street and this should not be the reason for employees to demand excessive compensation and leeways in terms of empathy which, in the end, can lead to pathetic results for the ultimate end users or clients.

Everyone is a stakeholder, one way or another. A balance of all perspectives, from technological ideas to basic necessities, expectations from one party to another and empathy towards the end users are critical as all these factors can balance out trust management within an organisation to ensure resilience in the marketplace. Finally, we should also be clear on the initiative, capabilities, experience, skill sets and, most importantly, the ability to create value of our self-worth, while being compensated for our contributions.

Embracing Your Vulnerability

Engineers are very susceptible to stress as the nature of our job requires precision, professionalism and accountability. In addition, engineers are mid-level managers who are answerable to the management team and, at the same time, they are also required to manage the skilled workforce. Working in such highly stressful environments, engineers should be well aware of and be willing to embrace their true emotions.

Subconsciously, we may feel vulnerable when having to express our true emotions to others. In reality, there is nothing to feel bad about being frustrated, depressed, overwhelmed, etc. as we are all humans who have our own challenges in life, family, career, stability and social status. These worries may manifest into emotions that are hard to suppress, but these are better off when unleashed in a correct manner so that we can release our built-up stress and tension. By learning to embrace our emotions and vulnerability, we will acquire the confidence to find a safe space to open up, recover and to build greater mental resilience.

In a male-dominated profession, it cannot not be denied that there will be some form of hindrance when a male professional has to report to a female superior, be it in terms of emotion, attitude and/or even the feeling of inferiority. This should not be the case as, regardless of gender, we should always remain professional; always keep in mind that this is the engineering profession and what determines our success is our technical knowledge and capabilities, paired with management and leadership skills.

PURE POLYURETHANE UV-RESISTANT LIQUID APPLIED ROOF WATERPROOFING SYSTEM

SikaRoof[®] MTC-08 UV AP is a polyurethane resin based, coloured, cold applied liquid, seamless, crack bridging, UV resistant, low maintenance roof waterproofing system. It is designed for roofs with numerous details such as penetrations, drains, roof lights and complext geometry with high reflective roof coating to enhance energy efficiency.

BUILDING TRUST

The very closed and traditional mindset of a seniority structure in which the senior is always right, should also be revoked. Junior professionals should be empowered with the self-confidence to voice their concerns, views and opinions freely without having to worry about backlashes or other unrelated consequences. Don't forget that the younger generation is a pool of future leaders, so they should be groomed to lead and voice out their concerns and opinions for the betterment of the industry. In fact, humans from all walks of life should act with complete professionalism, integrity, responsibility and accountability.

Channels for obtaining professional assistance with regards to mental wellbeing can be found easily online, thanks to the improvement of connectivity. Many organisations offer their services online and engaging professional help will enable us to understand the true cause of our emotions and thus resolve the issue. In addition, it is organisations like these that serve as the intermediatory link or the outlet for us to voice out our thoughts to a professional. This then allows our mind to be "free" which will lessen the burden for us to unleash our creative side.

"We are all resilient from the day we are conceived. Some of us thrive and are able to manage very well; others may take a longer time to do so and there are also those who don't. Emotion and intelligence goes hand in hand; it is the core of being human. Applying EQ resilience to lead and utilising your IQ to up skills, is the way towards better resilience," says Dr Sangeeta Kaur, Managing Director of Emerging Journey Asia.

"A holistic approach to emotional and mental wellbeing is part of growth and development. There are times when we are required to lead by the heart instead of technical intelligence (bear in mind that human are not robots) or what we think is right. A balance of both mental and emotional states is critical for overall wellbeing."

Entering the Industry in a Time of Uncertainty

Humans are social creatures and from early childhood, our education system is based on a face-to-face arrangement in which we get to meet our classmates and teachers physically in classrooms. As we move on to higher education, we learn through group projects and holding discussions with one another. All these work to help prepare us for the time when we will be entering the workforce.

Communication and teamwork are just the basic necessities required for us to be an all-rounder in this next stage of our life. As we near graduation, we look forward to entering the industry. Armed with high hopes and the goal to be an accomplished engineer, some of us may even start filling in job applications before we sit for our last paper in the examinations. The lucky few who have managed to secure full-time positions even before the final week of lectures have ended, will be looking forward to joining the workforce with vigour and passion as well as dreams to doing good engineering work for the benefit of mankind.

Unfortunately, barely weeks into their new career, Covid-19 wreaked havoc throughout the globe and everything came to a standstill. Everyone was instructed to work from home and fresh graduates who had just entered the industry and perhaps had not even had the time to get acquainted with their fellow colleagues, would have felt bleak and lonely as they struggled to cope with working from home in full virtual mode as well as learn new technical jargons and concepts on their own. It would seem that all hopes for a successful career were dashed.

Not quite. Ms. Choong Pooi Ying, a young, enthusiastic, resourceful and open-minded engineer, refused to overworry or complain as doing so would not solve the issues. A growth mindset is most important when facing tough circumstances. By adopting a growth mindset, we can focus on finding the means to develop and improve such as trying new challenges and accepting feedback and criticism. This ties in with engineering a resilient future as we will continuously improve ourselves and find the

best mean to survive.

To be prepared to enter the industry/ workforce, we should ask ourselves questions such as "What do we really want to accomplish in life?", "What kind of future do we envision for ourselves?", "What kind of self are we are trying to develop?" and "Do we aspire to be an accomplished engineer who brings benefits to mankind?".

It is by having clear objectives and a strong sense of belonging that budding engineers can plan their career and personal development even before graduation. To achieve these,

they can look to seeking ideas and guidance from seniors or peers and even having a mentor in the industry discipline that they are interested in who can guide them towards achieving their objectives. With proper guidance, these budding engineers can start their journey towards professional registration and competency certification.

Engineering graduates who wish to practise in Malaysia should also be aware that it is mandatory to first register with the Board of Engineers Malaysia (BEM) as a Graduate Engineer. On top of that, it is vital that you read, digest, understand, then practice in accordance with the Registration of Engineers Act 1967 and Engineer's Code of Conduct (CoC) as these serve as a guideline for becoming ethical and competent engineers. All these indicate our commitment to the engineering fraternity and, at the same time, will enhance our value and demonstrate competency.

Learning from mistakes and a willingness to admit to mistakes are also a must in the industry. Put aside your ego. For newcomers to the industry, your team members at all levels, including technicians and skilled workers, will be your best teachers at the workplace. You may be a graduate with an engineering degree but you are not yet furnished with the technical skills and knowledge; these can only be acquired through working hands-on in the job.

Learn to accept criticism, take the initiative to ask questions and perform tasks humbly. This way, you will find that you are able to pick up technical skills and knowledge faster. On a side note, fresh graduates must also understand that although it is good to do as many tasks as possible in order to learn as fast as possible, you must also know your own limitations and capacities as some tasks may require a competency licence; furthermore, too much work may lead to pre-mature burnout which will be detrimental to your health, physically and mentally.

The key to building resilience is to have a clear objective on why and what you are working towards, a balanced lifestyle, the constant desire to improve and knowing when to take a break when it's required.

Top Tips for Engineering Graduates Entering the Industry:

- Adopt a growth mindset
- Find your inner resolve
- Have clear career and personal development goals and objectives
- Always seek advice and guidance from others
- Register with the mandatory statutory authority (i.e.: Board of Engineers Malaysia or BEM)
- Don't be afraid to make mistakes and to learn from them
- Put aside ego and learn from everyone
- Take a break whenever you feel you need a break!
- Don't be complacent

Are You Ready to be Resilient?

After considering the views of three individuals in different career levels and roles, we can see that to be resilient is not only about ourselves but it's also about others around us. Resilience does not apply only to engineers but it is also a general outlook for all of us. Resilience not only builds the engineering fraternity, but it is also the backbone in building the nation as a whole!

Circulation and Readership Profile

JURUTERA has an estimated readership of 200,000 professionals. Our esteemed readership consists of certified engineers, decision making corporate leaders, CEOs, government officials, project directors, entrepreneurs, project consultants, engineering consulting firms and companies involved with engineering products and services.

Advertising Benefits

Our business partners can be assured that their products and services will be given the circulation and exposure they deserve, thus maintaining a sustained advertising presence to our core readers of decision-making engineers and technical experts. Our website offers an even wider market reach, with added international presence, aided by our international affiliation with official engineering bodies all over the world. Our online and offline advertising features such as banner advertising, article sponsorship and direct e-mail announcements have proven to be successful marketing strategies that will set the businesses of our partners apart from their competition.

Bacterium Encapsulated In Alginate As A Self-Healing Agent In Autonomous Healing Mortar

Written and Prepared by:

Raden Maizatul Aimi Mohd Azam Civil & Structural Engineering Branch, Public Works Department

(PWD)

Hamidah Mohd Saman

School of Civil Engineering, College of Engineering, Universiti Teknologi MARA (UiTM) Malaysia

Noorli Ismail

Faculty of Civil Engineering & Built Environment, Universiti Tun Hussein Onn Malaysia

rack formation is a common durability-related phenomenon in many concrete structures. While larger cracks compromise structural integrity, smaller sub-millimeter cracks can cause durability issues due to increased matrix permeability caused by particularly connected cracks. Routine manual maintenance and repair of concrete structures can be expensive and, in some cases, unattainable.

Therefore, including an autonomous self-healing repair mechanism would be highly beneficial as it would reduce maintenance while also increasing material durability. The autonomous healing concrete by microbially induced calcite precipitation has sparked a lot of interest in sustainable concrete repair and maintenance solutions. The biologically inspired material for self-healing concrete has been introduced with Geobacillus stearothermophilus encapsulated in alginate (AE-GS). In this study, the vegetative cells of Geobacillus stearothermophilus were encapsulated in alginate-hydrogel before it was added to mortar. Scanning Electron Microscopy (SEM) was used to examine the encapsulated strain and its characteristics to confirm the presence of encapsulated bacteria. The performance of AE-GS in mortar mixture as a self-healing agent was measured by compressive strength and crackhealing efficiency. The healing efficiency of AE-GS was used to determine its suitability as a crack repair material. When comparing it to those with a lower replacement level of AE-GS and a lower concentration of bacteria, the results showed that incorporating 15 % AE-GS with1×10¹¹ cfu/ml bacteria concentration resulted in maximum crack healing of 80%. Geobacillus stearothermophilus was found to be capable of inducing self-healing by utilising the available nutrients in its environment. The combination of Geobacillus stearothermophilus and alginate gel beads provided an intriguing approach for crack remediation using the autogenous healing concept.

Thermophilic Type Bacterium

Geobacillus stearothermophilus is a thermophilic type bacterium capable of thriving in high temperatures (30°-75°C) which can be found in the geothermally heated region such as hot springs [1], [2]. In a harsh environment, *Geobacillus stearothermophilus* produce endospores [3] and its morphology and resistance properties allow it to be mobilised in the atmosphere and transported over long distances [4]. Furthermore, the longevity of *Geobacillus stearothermophilus* allows it to lie dormant but viable in extreme conditions for long periods.

This study focused on 2 major issues:

- The development of autonomous healing concrete using Geobacillus stearothermophilus and
- The suitability of AE-GS as a new smart material to be investigated for use in concrete repair and maintenance.

Concept of Autonomous Healing

The continuous ingress of water and chemicals in crack propagation would eventually cause premature matrix degradation and corrosion of embedded steel reinforcement if not properly treated [5]. In contrast, adding the bacteria-based healing agent during the mixing process would solve the problem. The bacteria-based healing agent would be activated by the crack and water entering the concrete, resulting in abundant mineral precipitation. This mineral precipitation aids in crack closure and prevents further entry of harmful materials, protecting the reinforcement from corrosion. This concept of self-healing is illustrated in Figure 1.

Figure 1: Schematic drawing of conventional concrete (A-C) vs bacteria-based self-healing concrete (D-F) (courtesy of Jonkers) [9]

The most common and well-known pathways to precipitate calcium carbonate (*CaCO*₃) is by enzymatic hydrolysis of urea (*CO*(*NH*₂)₂ from bacteria through the biomineralisation process [6]– [8]. Urea hydrolysis can produce high concentrations of carbonate and is the most easily controlled reaction to generate carbonate [9], [10]. The equation for this chemical reaction shown below:

 $(CO(NH_2)_2 + 2H_2O \rightarrow 2NH_4^+ + CO_3^{2-})$

The combination of calcium (Ca^{2+}) from feeding solution or local environment with carbonate ions (CO_3^{2-}) resulting in the formation of calcium carbonate $(CaCO_3)$ as in Equation 2 shown below:

$$Ca^{2+} + CO_3^{2-} \rightarrow CaCO_3$$

Materials & Methods

The materials for producing *Geobacillus stearothermophilus* encapsulated in alginate (AE-GS) mortar mixes are described in the following subsections.

Bacterial Strain: *Geobacillus stearothermophilus* (ATCC 12978) with medium growth of sterile nutrient broth (NB) containing beef extract and peptone was used to culture living cells. The cells were harvested by centrifugation prior to the encapsulation process.

Encapsulation Process: The encapsulation processes were set up to keep the bacteria safe while it passed through as inert material. Sodium alginate was used as a gelling agent. The nutrient source for the bacteria required yeast extract, urea and calcium lactate with calcium chloride as a cross-linker.

Scanning Electron Microscopy (SEM): Two specimens were prepared for SEM testing. First, the *Geobacillus stearothermophilus* for its shape and morphology. Second, the condition of *Geobacillus stearothermophilus* after 28 days of being encapsulated and submerged in the cement slurry.

Determination of mortar mix proportion and casting process: The mortar mix design was based on a cement-to-sand ratio of 1:3 and a water-to-cement ratio of 0.5. The chemical used for encapsulation (AE) was calculated based on the weight of total replacement at 3%, 9%, and 15% by weight. Two bacterial concentrations (BC) were used, namely 1x10³ cfu/ml and 1x10¹¹ cfu/ml and 9 batches of total mix designations were produced. There were 3 batches of alginate-encapsulated without *Geobacillus stearothermophilus*, namely R (3%), R (9%) and R (15%) and 6 batches of *Geobacillus stearothermophilus* encapsulated in alginate (AE-GS 1 to AE-GS 6). The R and AE-GS batches were mixed in the proportions as shown in Table 1. Before the mixing phase, AE-GS was prepared. In a dry mix, cement and sand were combined and then AE-GS was added.

			Alginate – Encapsulation ^a				Mortar ^b			
Batch	AE (%)	BC (cfu/ml)	dH²O (ml)	Sodium Alginate (gram)	Calcium Lactate (ml)	Urea (ml)	Yeast Extract (ml)	Cement (kg)	Sand (kg)	Water (litre)

AE-GS 6	15	1×10 ¹¹	5194	100	400	400	666.0	9.4	28.3	4.7

Table 1: Mix proportion of mortar with Geobacillus stearothermophilus encapsulated in alginate (AE-GS)

^a Encapsulation composition for alginate encapsulated without Geobacillus Stearothermophilus (R) and Geobacillus stearothermophilus encapsulated in alginate (AE-GS)

^b Material constituents for batch R and AE-GS

Experimental Method

The experimental work on *Geobacillus stearothermophilus* encapsulated in alginate (AE-GS) is detailed in the following sub-sections:

Compressive strength: The mortar specimens were tested for compressive strength following BS EN 12390-3:2009. The compressive strength of the specimens was tested at 7 and 28 days. The dimensions of the specimens are 50 mm x 50 mm x 50 mm. The compressive machine was set to a pacing rate of 3.0 kN/sec.

Quantification of healing efficiency: The realistic cracks were created with 40 mm cylinder with a diameter of 100 mm using a Universal Testing Machine (UTM) Type 1000. All specimens were subjected to a pacing rate of 15% and a compression load of 0.083 kN/s to build several realistic crack widths.

Visualisation of crack filling: A portable stereomicroscope (Dino-Lite camera) was used to examine the crack filling. Initial and final images were taken after incubation under wet-dry cycles for 7, 28 and 60 days. The image of crack widths was taken at two locations for each sample. The healing ratio by the width decrement is calculated using Equation 3 [11] below:

Healing (%) =
$$\frac{Cw_i - Cw_f}{Cw_t}$$

where Cw_i is initial crack width, Cw_f is final crack width and Cw_t is a total initial crack width. The self-healing with the aid of bacteria is mainly due to microbial precipitation of calcium carbonate; the quantification crack healed by the bacterial deposition will be an indicator for healing efficiency [12]. The data obtained was analysed and the results were averaged.

Results & Discussion

Scanning Electron Microscopy (SEM): Based on observation via the SEM image in Figure 2, the *Geobacillus stearothermophilus* is a rod-shaped cell as defined by Zeigler [4] and Nazina *et al.* [13]. *Geobacillus stearothermophilus* can be encapsulated in alginate hydrogel while retaining all its incorporated nutrients (Figure. 3). This shows that an alginate hydrogel can both protect bacteria and facilitate in a concrete environment.

Figure 2: Geobacillus stearothermophilus (15000 x magnification, 200 nm)

Figure 3: Geobacillus stearothermophilus encapsulated in alginate-hydrogel (3000 × magnification, 30μm)

Experimental Results

Compressive strength: The results (Figure 4) showed that when AE-GS was used at a higher percentage, such as 15%, the strength of the specimens was significantly reduced. In comparison to other batches, the lower percentage of AE-GS (3%) with a higher bacterial concentration ($1x10^{11}$ cfu/ml) had the highest compressive strength. A 15% replacement of AE-GS in the mortar resulted in a significant decrease in compressive strength as opposed to a 9% replacement of AE-GS in the mortar.

The results (Figure 4) also indicated that the strength decreased considerably with a higher incorporation of AE-GS, for instance at 15% replacement. The lower percentage of AE-GS (3%) with higher bacterial concentration (1x10¹¹ cfu/ml) recorded the highest compressive strength. A major reduction of compressive strength was observed on a 15% replacement of AE-GS in the mortar as compared to 9% and 3% replacement of AE-GS. In comparison to the direct incorporation of bacteria, which had a positive impact on compressive strength, the strength of the concrete decreased after the addition of AE-GS. Raden Maizatul Aimi *et al.*, [14] found that a higher concentration of *Geobacillus stearothermophilus* had a direct impact on early strength as early as 3 days when compared to a control mortar.

Figure 4: Compressive strength for the mortar cubes

Quantification of crack healing: The reference was made by combining alginate-hydrogel with no bacteria (R). The incorporation of AE-GS improved the autogenous healing of mortar specimens (Fig. 5). The progression of the crack healing process can be seen in stereomicroscopic images of cracks taken at regular intervals (0, 7 and 28 days). The cracks were observed to gradually heal over time (Figure 6). After 28 days, cracked mortar with a higher replacement of AE-GS and a higher concentration of bacteria had healed completely. On the reference mortar, no deposition of calcium carbonate due to bacterial precipitation was observed.

Figure 5: Cracks healing percentage at 7 and 28 days. No healing was observed for reference samples

Figure 6: Crack filling with whitish precipitation by Geobacillus stearothermophilus (specimen in series AE-GS2)

Conclusion

results The of the study show that crack healing with Geobacillus stearothermophilus encapsulated in alginate (AE-GS) is significantly more efficient than crack healing with the same composition concrete but without the addition of bacteria (AE-R). The addition of AE-GS to the mortar matrix has two impacts. Firstly, AE-GS has a negative effect on compressive strength incorporation by of more than 9% in mortar. Secondly, higher AEreplacement (15%) GS higher bacterial and concentration (1x10¹¹ cfu/ ml) in mortar resulted in higher healing efficiency.

Higher bacterial indicate concentrations that more calcium carbonate precipitation will occur compared a lower bacterial to concentration (1x10³ cfu/ ml). The incorporation of AE-GS in mortar mix shows the occurrence of self-healing based

on stereomicroscope images. Maximum healing is achieved at 80% on the 28th day of observation. When 15% of the AE-GS is replaced as in AE-GS5 and AE-GS6, the strength drops between 17% and 24% compared to AE-GS replacement at 3% and 9%. The ability of alginate-hydrogel to encapsulate *Geobacillus stearothermophilus* and act as a vehicle protector (as an inert material) is demonstrated in this study. The ability of bio-based healing materials to activate when exposed to water, makes them ideal for situations where manual inspection or repair of concrete parts of a structure is impossible. Biomineralisation of *Geobacillus stearothermophilus* also implies that the bacteria will be successful in future potential methods of repair and maintenance.

IEM 62nd Annual Dinner & Awards Nite 2021

wo years had passed since we last gathered for the 60th IEM Annual Dinner & Awards Nite on 20th April 2019. It was a pleasant surprise for everyone concerned when we managed to put together a smaller but no less exciting event for the 62nd IEM Annual Dinner & Awards Nite on 26th December 2021 at One World Hotel in Petaling Jaya.

Of course we abided by the SOPs issued by the Ministry of Health and only 6 persons were allowed seated at each table. We also took other precautionary measures and preparations to ensure that all those who turned up for the event were well protected. These included presenting each diner with a safety kit containing antibacterial wet wipes, hand sanitisers and even an envelope for them to keep their masks during dinner.

Despite the tight measures and other constraints, IEM was extremely pleased to note that all had a good time interacting with one another and that they enjoyed meeting each other face to face again. A total of 543 members and guests attended the dinner.

IEM 62nd Annual Dinner at One World Hotel on 26 December 2021

The evening, themed Helping Engineers Achieve Resilience Together (HEART), started with the arrival of the guest of honour, YBhg. Datuk Ir. Hj Mohamad Zulkefly bin Sulaiman, the Director General of Jabatan Kerja Raya Malaysia. IEM greatly appreciated his taking time off from his busy schedule to attend the event.

In compliance with SOP requirements, dinner was served individually. As the guests enjoyed the first three courses, they were entertained by Kryptonite, a 4-piece live band who performed songs from the 1960s to current pop favourites.

Ir. Ong Ching Loon welcoming the guests to the 62nd IEM Annual Dinner and Awards Nite

In his speech, IEM President Ir. Ong Ching Loon thanked all members and guests for their support and the Annual Dinner Organising Committee for its efforts in making the event a

Ir. Ong Ching Loon presenting the IEM Honorary Fellow Award to Datuk Ir. Hi Mohamad Zulkefly bin Sulaiman

success. He said the 62nd Annual Dinner was particularly meaningful to IEM as even the IEM Committees, Council and Branches had not really met physically since the start of the Covid-19 pandemic. Nevertheless, IEM had seized the opportunities from the challenges and created many unprecedented "firsts" in the 62 years of its history, by having virtual Council and Excomm meetings, virtual Annual General Meeting, webinars, virtual technical visits as well as electronic balloting and e-Bulletin. IEM's very own mobile application, IEMGo, was also launched in April 2021.

In his speech, Datuk Ir. Hj Mohamad Zulkefly said he was very involved in IEM during his younger days as he had served as Treasurer of IEM Eastern Branch. He hoped IEM members and all engineers would come together and join forces to help the country bounce back from the impact of the global pandemic. For his contributions to the nation and to IEM, Datuk Ir. Hj Mohamad Zulkefly was conferred the IEM Honorary Fellow for 2021. IEM Past President Ir. Dr Tan Yean Chin was also conferred the IEM Honorary Fellow for his untiring services to IEM.

Awards were presented to notable individuals and organisations in recognition of their contributions to the profession and the nation. The five winners of the Contribution to Engineering Industry Award 2021 were:

Water Industry	Bacteria Free Water Engineering (M) Sdn. Bhd.
Power Energy & Green Technology Industry	KUB-Berjaya Enviro Sdn. Bhd.
Engineering Consultancy Practices (ECP)	Afrima Consulting Engineer Sdn. Bhd.
Construction and Property Developments	KLCC Projeks Sdn. Bhd.
Digital Industry	Centre of Excellence (COE) Petronas Carigali Sdn. Bhd.

The winner of the IEM Outstanding Engineering Achievement Award for 2021 was TRX City Sdn Bhd for its Design & Construction of the Sewerage Treatment Plant (STP) – The First Private Wastewater and Recycling Plant for the International Financial District, Tun Razak Exchange.

Every year, IEM Gold Medal Awards are given to top engineering students from local universities. This year, the 29 student winners were:

No.	Name	University
1	Lian Wen Xun	Asia Pacific University Of Technology
2	Sharon Hii Yiik Wei	Curtin University
3	Ahmad Irham bin Dollah	International Islamic University Malaysia
4	Choo Kam Khuen	Uow Malaysia Kdu University College
5	Bazil bin Faisal	Mahsa University
6	Jacob Yeo Hsiao Wen	Monash University
7	Yeoh Chuan Yoong	Nilai University
8	Shams Khaled Elhosseny Ghazy Essawy	University Of Notthingham
9	Shehab Khan Noor	Segi University

10	Marcus Tan Yen Wai	Tunku Abdul Rahman College
11	Hoon Jian Wen	UCSI University
12	Meldrick Ferris Lalas anak Peter	University College Of Technology Sarawak
13	Teoh Kooi Chuan	University Malaysia Perlis
14	Eugene Tang	Universiti Malaysia Sarawak
15	Kee Wee Boon	Universiti Tunku Abdul Rahman
16	Koo Zhong Yee	Universiti Tun Hussein Onn
17	Muhamad Farhan Mohd Mazlan	University Of Malaya
18	Hadi bin Alloha	Universiti Teknikal Malaysia Melaka
19	Ooi Teng Hao	Heriot-Watt University Malaysia
20	Janice Ng Jia Yee	Universiti Sains Malaysia
21	Ng Ying Li	Universiti Teknologi Malaysia
22	Stefano Ching Kiat Boon	Swinburne University Of Technology Sarawak
23	Aina Shahirah binti Ahmad Ishak	Universiti Pertahanan Nasional Malaysia
24	How Yu Yi	Taylor's University Malaysia
25	Wilson Tan Jye Lih	Southern University College
26	Chia Jason	Multimedia University
27	Toh Jian Heng	Universiti Teknologi Petronas
28	Teong Zee Khai	Universiti Kebangsaan Malaysia
29	Muhammad Amirul Fiqri bin Abdullah	Universiti Putra Malaysia

As part of its appreciation to members and organisations which had supported IEM in its membership drive activities in 2020, IEM presented the Top Membership Drive Awards to the following:

Graduate Membership (Individual category)	Ir. Kwong Kok Tze
Graduate Membership (Organisation category)	Petroliam Nasional Berhad (PETRONAS)
Corporate Membership (Individual category)	Ir. Gopal Narian Kutty
Corporate Membership (Organisation category)	Jabatan Kerja Raya Malaysia

The IEM Annual Dinner & Awards Night would not be the same if the hardworking Technical Divisions were not given due recognition for their efforts in organising activities for the benefit of members in their professional development. The following top Technical Divisions were congratulated for their relentless efforts.

Champion	Building Services Technical Division
First Runner-Up	Civil and Structural Engineering Technical Division
Second Runner-Up	Electrical Engineering Technical Division
Third Runner-Up	Geotechnical Engineering Technical Division
Fourth Runner-Up	Mechanical Engineering Technical Division
Most Improved Technical Division	Environmental Engineering Technical Division

Because of the global pandemic and the imposition of the MCO from 18 March 2020, IEM have had to move all events and activities to virtual platforms. As the President mentioned in his speech, IEM had done very well in this area and in special recognition and appreciation for outstanding performance, contributions and efforts by the Technical Divisions, Special Interest Groups and Sections, the Best Virtual Activities Awards was introduced.

The awards were presented for virtual activities organised in 2020. There were 2 categories:

- 1. The Highest Number of Virtual Activities Conducted and
- 2. The Highest Paid Numbers of Participants for Virtual Activities Conducted.

For the Highest Number of Virtual Activities Conducted, the winners were:

Champion	Electrical Engineering Technical Division
First Runner-Up	Project Management Technical Division
Second Runner-Up	Civil & Structural Engineering Technical Division

For the Highest Paid Numbers of Participants for the Virtual Activities Conducted, the winners were:

Champion	Electrical Engineering Technical Division
First Runner-Up	Tunnelling & Underground Space Technical Division
Second Runner-Up	Project Management Technical Division

As usual, there was a lucky draw with prizes that included smart watches, mobile phones, buffet dinner vouchers, hotel stay voucher and smart tablets. This exciting segment closed the evening with a cannon confetti and good night to the guests.

IEM wishes to thank all parties, sponsors, guests, Committee members and the Secretariat for the successful event and looks forward to the 63rd Annual Dinner & Awards Nite in 2022.

Engineers' Resilience In Inevitable Changes

Written and Prepared by:

Ir. Melaty binti Ghazali Vice Chairman II Women Engineer Section IEM, 2021-2022 session

Ir. Hanizah binti Argadan Ordinary Committee Member Women Engineer Section IEM, 2021-2022 session

Ir. Noraidah binti Yahya

Ordinary Committee Member Women Engineer Section IEM, 2021-2022 session

he impact of the COVID-19 pandemic is unprecedented in history. In Malaysia, the global crisis shook the engineering and construction industry almost to its core, necessitating the urgent need for the industry to reform and improve its resilience to thrive in a volatile, uncertain, complex and ambiguous future.

Resilience is not only about risk mitigation to enable a swift elastic return back to a prior state, but also about the adaptive capacity to navigate the uncertainty — i.e., the ability to adapt to a world that is permanently under transformation, where both social and physical elements are mobilised. In our context, resilience can be defined as the adaptive capacity of the local engineering and construction industry to survive and thrive in the changing environment.

Industrial 4.0: From Concept to Reality

The pandemic expedited local transition towards the 4th Industrial Revolution (4IR) since the implementation of Movement Control Order (MCO) which severely limited our movement and physical interaction. As such, the internet and online communication became the default modes of interaction and medium for sharing and disseminating information. For efficient day-today productivity and delivery, high specification hardware, internet speed, data storage capacity and network licence for engineering software are now essential norms and crucial requirements for engineering professional service works. It is expected that in the future, information-based construction management methods (such as building information modelling (BIM), augmented reality (AR), virtual reality (VR), robotics 3-D printing, artificial intelligence (AI) and drones will be the daily tools to enable the full integration of people, process and machines in any project lifecycle.

Integrated Design Management via Building Information Modelling

Building Information Modelling (BIM) is a method of managing building design and project data in digital format throughout the lifecycle of a building. BIM is becoming one of the important technologies to enable efficient and effective lifecycle management of the built environment as it reduces risk, improves productivity and extends the sustainability of a construction project.

In the context of modern construction projects which are more complicated to manage, the adoption of BIM has now turned into a major agenda to help resolve communication issues between stakeholders. Appreciating the potential benefits of reduced transaction costs and operational errors, the Public Works Department (PWD), a leading technical agency for the Malaysian Government and in the country, has included the use of BIM for projects above RM10 million as outlined in its Strategic Plan 2021-2025. Specifically, PWD targetted 50% of its projects to adopt BIM in 2021, with a yearly increment of 10%.

The use of BIM in the building industry is beneficial in terms of creating a shared understanding between stakeholders working in different locations, which potentially leads to 3-D model optimisation such as in 3-D prints, animations and virtual reality.

Augmented Reality

Augmented reality is another piece of technology that enables remote collaboration and knowledge transfer. It can be described as both an information aggregator and a data publishing platform that allows the users to: 1) passively view displayed information, 2) actively engage and interact with published contents and 3) collaborate with others in real-time from remote locations. By offering additional access to information and further opportunities for enhanced collaboration, AR supports decision making on-site, thus promoting resilience in the workforce.

Automation and 3-D Printing

One main challenge during the pandemic was the exacerbated shortages in skilled craft and the need for social distancing even at construction sites. The local construction industry must, therefore, be agile and possess the capacity to respond effectively to these changing external conditions. The advancement of technology in the form of construction robotics and automation, offers the solution for a sanitised and remote job site. Nevertheless, multiple technological challenges, such as those related to the human-technology interface, still need to be addressed to make these innovations fully practical and be able to operate smoothly.

Staffing and Skill Training

In addition to investing in emerging technologies, what else does an organisation need to rebound and change, post-pandemic? Some strongly believe it is people as they matter the most; after all, it is the people who will drive the adoption of advanced technology and thus ensure successful business transformation. As such, staff recruitment and training must be given careful attention.

In engineering services, the design stage is the process that requires professional ingenuity to fulfill specific design intentions. This stage needs to be managed properly. One key issue in design stage management is the business disruption in maintaining or stabilising the workforce. Some of the strategies to overcome this disruption are creating multiple points of contact, cross-training employees on identical tasks, developing succession and transition plans and creating a collaborative culture within the firm. Ideally, these strategies will become essential preconditions to deliver knowledge and skills training for employees, i.e., this should be done as a part of a preparedness programme when a business is running in normal conditions, in order to reduce the risk of business disruption and thus help protect profits.

An engineering consulting firm, for instance, might not be able to disperse professional services when there was no competent employee in information communication technology (ICT) readily available during the first MCO from 18 March to 3 May 2020. This was because, during the first MCO, there was a surge in the use of online video conference platforms such as Google Meet, Zoom, and Webex. These have become the new norm for business meetings today. In addition, cloud licensing for engineering software had also become commonly used which hinders software counterfeiting. It was clear then that to survive, the engineering professional services firm had to be agile and resilient.

As engineers, we should use our skills to support economic recovery and the switch to green technology. To successfully transition from traditional economy to IR4.0 requires new skills in engineering, similar to if we are moving from a labour-intensive factory to an automated factory where the traditional machinist workforce must be retrained to be automation engineers. In short, IR4.0 requires a skilled workforce in data science, machine learning, computer simulations, system engineering and robotics, many of which are areas with severe skill shortages.

It should also be noted that, in line with the national digital goals for IR4.0, the Government had planned to strengthen the national digital capabilities, as well as to equip the workforce with the right skills to support the enhanced national digital structure (such as improved internet connectivity and expanded 5G technology).

Industrialised Construction

Industrialising building systems, which is termed Industrialised Building System (IBS) in Malaysia, can help simplify the process of design and construction without having to recreate a unique process for each project. IBS includes offsite prefabrication and modularisation to reduce waste and carbon emissions as well as parallel coordination between onsite and offsite works to enhance quality control.

IBS had been on the national agenda for project development construction since early 2003 with the introduction of the IBS road map. It was later incorporated into the 2016-2020 Construction Industry Transformation Programme (CITP), a five-year programme to enable sector-wide transformation to ensure the industry remains productive, resilient and sustainable.

As documented in the CITP report card to the Ministry of Works on 4 March 2021, the five-year programme resulted in significant positive changes in productivity of the industry across the CITP's four strategic thrusts: Quality, Safety and Professionalism, Environmental Sustainability, Productivity and Internationalisation & Competitiveness.

To boost the productivity rate in the construction industry, several measures were introduced in the CITP to facilitate its transition from a labour-intensive sector to one based on technology. A key initiative was to promote and regulate the use of IBS, which allowed for shorter project completion timelines and enhanced quality of work. In light of this governmental initiative, PWD initiated the implementation of IBS in its project developments as early as 2000. The effort began with the design office taking the initiative to use pre-cast reinforced concrete frames or loadbearing walls. The programme was continued in bits and pieces until the Ministry of Finance (MoF) issued a formal instruction to enforce IBS in Federal Government projects costing more than RM10 million (PK 1.4) from 15 January 2020. It was also mandated that IBS should be implemented in no less than 70% of all suitable government projects.

It should also be noted that the private sector seemed reluctant during the early stages of IBS implementation. Nevertheless, with the government's persistent initiative and generous incentive for IBS implementation, the private sector started to embrace the programme as clearly indicated in Chart 1.0, which plots the significant uptake of

IBS in private sectors from 2014 to 2020. Chart 2.0 shows the corresponding value of construction work done in ringgit from Q1 2019 to Q3 2021. With 41% of IBS implementation in the private sector in 2020, the overall value of IBS was quite encouraging, estimated at around RM4.2 billion.

Chart 1.0: IBS implementation in public and private sectors from 2014 to 2020 (Source: CIDB Malaysia)

Chart 2.0: Monetary value of construction work done by project owner (from Q1 2019 to Q3 2021) (Source: Quarterly Construction Statistics, Third Quarter 2021, Department of Statistic Malaysia)

Opportunity

Governmental Support in Post-COVID19 Economic Recovery

The emergence of fast-spreading variants of the COVID-19 virus continues to affect global health and economy. However, there is light at the end of the tunnel, with encouraging signs of a local economic recovery driven by the accelerated vaccination programme and high fiscal support by the Government.

Since the onset of the pandemic, the Government has launched many economic stimulus and relief packages as recorded in the National Budget 2022 tabling on 29 October 2021. The Government has pledged to remain agile and flexible in providing the necessary fiscal support to the people and businesses to help us bounce back and ensure a sustainable recovery.

After a moderate rebound in 2021, Malaysia's economic momentum is expected to pick up even faster in 2022 with the broader re-opening of the economy as well the projected mass national vaccination programme. Headline inflation is expected to decrease slightly in 2022. The unemployment rate will improve in tandem with the pick-up in economic activities and higher demands for labour.

Table 1.0 tabulates Malaysia's growth by sector, while Table 2.0 lists the inflation and unemployment rates, for 2021 and 2022.

Table 1: Growth by sector					
Year	2021 ^e	2022 ^f			
Overall	3 - 4%	5.5 - 6.5%			
Construction	0.8%	11.5%			
Manufacturing	2.6%	4.7%			
Services 8.1% 4.7%					
Agriculture	-0.8%	3.9%			

^{*} e = estimates f = forecast Source: Ministry of Finance Malaysia

Table 2: Inflation and unemployment rate

Year	Inflation	Unemployment
2021°	2.1%	4.0%
2022 ^f	2.4% 4.6	4.8%

* e = estimates f = forecast Source: Ministry of Finance Malaysia

Workforce Opportunity

Engineers shape the future. As such, during this challenging period of rebuilding, the industry must be creative and swiftly apply advances in technologies to meet the changing industry demands. The industry needs also to be flexible with the workforce while not abandoning the social drive for diversity and inclusion. As the workforce transitions from traditional to a more advanced skillset, the industry should look to leverage on transferable knowledge and experience, while investing in training personnel with skills necessary to rebound from the current pandemic.

Engineering Industries Resilience

Chart 3.0 is the summary of a simple study conducted recently to investigate the career trajectories of engineering degree holders, post-graduation. The samples were Malaysian graduates who had registered with the Board of Engineers (BEM), based on the online BEM database in December 2021 and university graduates from statistics published by the Ministry of Education (MoE) from 2015

to 2020. The statistics from MoE showed the number of university graduates in engineering, manufacturing and construction which was assumed to include architectural, quantity surveyor and town planning graduates. The result indicated a significant gap between the number of BEM registrations and the number of university graduates in 2019 and 2020. The number of graduates in 2020 far surpassed the number of BEM registrations in 2021 by 37% (equivalent of 95,000 graduates). Even when the number is subtracted by 10,000 to account for possible registrations with the board of architect, quantity surveyor and town planning, the gap of BEM registrations is still significant.

Assuming the acts which mandate all engineering graduates to register with BEM before employment and practice as engineering professionals per the Engineers Act 1967 is strictly enforced, the mystery remains: Where are all these graduates? Are they employed in the industry without the BEM registration (and hence not in compliance with the law) or have they changed their profession due to fewer job opportunities in the market?

Chart 3.0: Comparison number of university graduates and BEM graduates register

It is therefore suggested that a dynamic tracking mechanism of engineering graduates be established, published and regulated by the BEM to keep track of engineering graduates in future as well as prospective engineering employers. This is in line with the stipulated role of the BEM, which is to regulate the conduct and ethics of the engineering profession and the National 4IR Policy. This effort will assist employers and the government to match and employ or to re-train graduates to cope with the changing needs of engineering industries. Investment to re-train or re-employ the engineering graduates helps current employers to absorb the impact of the pandemic, thus preventing the loss of these graduates to nonengineering fields and ensuring the existence of the current engineering employer as well.

Conclusion

The engineering professional must be agile and resilient in adapting and adopting the external changes in this fast-paced but uncertain environment. The readiness and willingness to embrace innovations towards realising IR4.0, such as those related to integrated work processes, information-based decision-making systems and online delivery platforms, will help engineers to survive and thrive. For a business organisation, medium and long-term strategic plans, as well as core investments in advanced technologies and skilled workforce, are necessary to take advantage of the structural support and opportunities laid out by the government.

Pearl Ring Roundabout

Written and Prepared by:

Ir. Dr Oh Seong Por

The Past Chairman of IEMNS and Director of Samsung SDI Energy (M). Sdn. Bhd.

earl Ring Roundabout, Pudong Pedestrian Roundabout, Lujiazui Roundabout and Mingzhu Roundabout are names that refer to the same iconic infrastructure in Shanghai, China. This is the biggest roundabout in the heart of the financial district in Shanghai Metropolitan with a large elevated circular pedestrian overpass built over it.

The overpass is 5.5m from the street and is wide enough to allow 15 pedestrians to walk abreast. The overpass is accessible via a few elevators. Besides enabling pedestrians to cross the busy streets in safety, the overpass also offers them a clean, leisurely environment with a 360° view of the traffic intersections that converge at the roundabout below.

The roundabout is constructed as a five-leg type and the design is based on the latest turbo concept pioneered

by Dutch researcher Dr Lambert Fortuijin. It is basically a multi-lane roundabout with lane dividers to guide drivers to stay in the lane leading to the desired destination. The lane divider is also known as canalisation design and has the potential to cut down lane-change behaviour and hence the ability to minimise traffic accidents as stated in the research paper by Liu Qiujia of the Shanghai Jiao Tong University.

The Pearl Ring Roundabout is part of initiatives by the Chinese Government to construct eco-friendly structures. Since its opening in 2011, it has become a popular tourist spot, attracting both domestic and foreign visitors who come to admire the unique environment as well as to snap pictures.

I visited the Pearl Ring Roundabout a few years ago and managed to snap an aerial view photo from a nearby tower.

The Institution of Engineers, Malaysia Form of Contract for Civil Engineering Works [CE 2011]

CE 2011 on Late Payment

states that the Contractor is entitled to :-

- (a) a default simple interest of 6%; and
- (b) suspension of works after 14 days from the period of honouring with written notice.

Clause 58.3 & 58.4

CE 2011 on Prime Cost Sum

allows the Engineer to instruct the Contractor to carry out works under Prime Cost Sum instead of awarding or expanding it as Nominated Sub-Contract with no profit and attendance subject to the Contractor consent and agreement on rates & prices.

Clause 56.2(5)

CE 2011 on Provisional Sum

allows the Engineer to instruct that Provisional Sum be treated as Prime Cost Sum if he sees it fit and proper.

CE 2011 on Price Fluctuation

is allowed under Option Module B whereby it is applied to upward changes in price for cement, reinforcement bar, bitumen and diesel.

Clause 56.4

Empowering B40 Communities Through Urban Smart Farming

Written and Prepared by:

Ir. Assoc. Prof. Dr Syuhaida Ismail

he Women Engineers Section of the Institution of Engineers, Malaysia (IEM), in collaboration with the Institute of Electrical & Electronics Engineers (IEEE) and the Green Cities of Construction Research Group (GCCRG) of Universiti Teknologi Malaysia Kuala Lumpur, organised a corporate social responsibility (CSR) programme at Projek Perumahan Rakyat (PPR) Seri Semarak, Kuala Lumpur, last year.

The half-day programme on Smart Urban Farming IoT-Cementbiosis Solar Hydroponic for Pressing B40 Urban Poor Need amid COVID-19, involved 30 B40 communities of PPR Seri Semarak and a group of 14 volunteers from the Department of Social Welfare (JKM) and was aimed at empowering the B40 urban poor to become more independent and resilient in income elevation while facing an uncertain future through smart urban farming.

Members of IEEE and GCCRG gave a briefing on the activities of the day and introduced the Women Engineers Section, IEM, to the PPR Seri Semarak B40 community and volunteers from JKM

Members of the Women Engineers Section, IEM, putting fertiliser into poly bags of MD2 pineapple plants at the Agro Yard Seri Semarak

The programme, funded by the IEEE, leveraged on the technovation of the Internet of Things (IoT) and maintenance-free, solar-powered Nutrient Film Technique (NFT) hydroponic project constructed in the Agro Yard Seri Semarak, using low-maintenance-high-constructability cement-based materials. It is expected to empower 20,000 B40 communities living in 1,580 units of low-cost apartments in 5 blocks of PPR Seri Semarak, through self-consumption and the sale of the hydroponic plants. At the same time, IEEE hopes that PPR Seri Semarak can be established as the Smart Community Urban Farming Training Centre for IoT, smart agro application, smart solar system and NFT hydroponic for another 23 PPR in Malaysia.

The role of the Women Engineers Section was to provide the subject matter expertise of IoT and smart application for real-time monitoring of the hydroponic plants connected to the internet via the existing PPR Seri Semarak Community Internet Centre. During the 2-hour session, the women engineers, led by Ir. Noorfaizah Hamzah, the Chair, and facilitated by Ir.

Mah Siew Kien, Ir. Noraidah Yahya, Ir. Hanizah Argadan and Assoc. Prof. Ir. Dr Syuhaida Ismail, answered the many questions and responses from the community on the best practices of the IoT and real time monitoring system for the hydroponic plants. This event is the first programme involving the Women Engineers Section which will continue to contribute in endeavours on other technical aspects of the project through training, talks and consultation in the near future until its completion in December 2022.

Time for a photography session after a tiring but fulfilling event at PPR Seri Semarak

Community Service Responsibility Collaboration Projects At Kg. Layang-Layang Kanan

Written and Prepared by:

lr. Assoc. Prof. Dr Zahiraniza Mustaffa

Ir. Ts. Noorfaizah Hamzah

Assoc. Prof. Ts. Dr Habibah @ Norehan Haron WE, Universiti Teknologi Malaysia

Teknologi PETRONAS

WE, Universiti

UTP organised the bokashi composting project and presented 30 bokashi bins to selected villagers. In this project, villagers learnt more about bokashi composting techniques which would help them make a sustainable living through green technology. Bokashi composting is an anaerobic process where food waste is fermented in an airtight container that isolates the waste from oxygen as much as possible. The liquid produced is a very nutritious "bokashi tea" that can be used as fertiliser.

Bokashi compost bins which were presented to the villagers

Volunteers from UTM and NU joined hands to conduct STEM activities such as Moh Main@Toy Box and other games for 30 preschool and kindergarten children. The first activity was a toy library session where the children were given STEM toys to play with. The next activity was colouring on sheets with images of the various careers that STEM offers. In the paper plane STEM challenge, the children were taught to make a paper airplane and then

he Women Engineers (WE) Section organised a community service responsibility (CSR) collaboration project at Kampung Layang-Layang Kanan, Parit, Perak, on 15 January 2022. The village is located along Sungai Perak and is popular for its fish (ikan tilapia and patin) farming activities.

The half-day event was initiated by Universiti Teknologi PETRONAS (UTP) and supported by Universiti Teknologi MARA (UiTM) Shah Alam, Nilai University (NU), Negeri Sembilan and Universiti Teknologi Malaysia (UTM) Kuala Lumpur. Taking part were 49 volunteers (7 WE members, 10 academics and 32 students) and 150 participants. The event was officiated by YBhg. Parlimen Parit, Dato' Mohd Nizar Hj. Zakaria.

The collaboration project showcased several activities targeted at the various age groups, from adults to primary/secondary schoolchildren and kindergarten/ pre-school children. These included bokashi composting, Jom Kenali Jurutera, Moh Bancuh Konkrit!, Sukaneka, Moh Main@Toy Library Box, Guna Air, Mentol Menyala, Sembang Keusahawanan and a gulai patin tempoyak cooking competition.

Jom Kenali Jurutera was designed for secondary school students. In this motivational talk, WE members described scopes and careers in the various engineering disciplines. At the end of the session, students took part in a pop quiz activity.

WE also organised Moh Bancuh Konkrit! which introduced the main construction concrete material to primary school students. The young students made an imprint of their hands on the fresh, hand-mix concrete which was later presented to them as a memento. It was hoped that this hands-on activity would spark the interest of the children in engineering field.

Happy International Women's Day

EMPOWERING WOMEN IN ENGINEERING

A tribute to women for making the world a better place

Engineering is instrumental in shaping our environment and building infrastructure. Regardless of gender, we have the integrity, capability and a collective responsibility of building and shaping the world we live in.

The children then proceeded to make, improve and fly their paper airplanes. Judging was based on creativity, distance flown and length of plane. The UiTM volunteers continued the fun in Sukaneka with games such as ping-pong cup, giant walk and a crawling game.

UTM showcased a technology-based activity to 28 primary school students in Guna Air, Mentol Menyala which used a Pico hydro turbine to generate electricity. Students were also introduced to new knowledge on renewable energy through experimental activities led by Assoc. Prof Ir. Dr Shamsul Sarip.

UTM conducted two sharing sessions for 23 adults, namely Starting F&B Restaurant Business (Dr Ruzana Ishak) and Sembang Keusahawan (Dr Noorlizawati Abd Rahim). All participants gave positive feedback in this knowledge-added session which showcased creative thinking approaches, improving existing business products and identifying new business opportunities.

Finally, 20 villagers took part in a cooking competition with the theme, gulai patin tempoyak. Ir. Rusnida Talib of WE was among the judges for this competition.

WE volunteers checking out the fish farming floating cages

After the closing and prize-giving ceremony, WE members and other volunteers were treated to a barbecue of charcoal-grilled fish at the riverside. Indeed, this CSR collaboration project was one of its kind and WE looks forward to more activities with the villagers in the future.

IEM - HWUM Student Section Health And Wellness Series Ep1: Taking Relationships To A New, Healthy Norm

Written and Prepared by:

NYAN SHU QI (MEng Chemical Engineering Year 4 Student)

n conjunction with the IEM Health & Wellness Series organised by IEM YES HQ, IEM-HWUM Student Section is honoured to be part of the series as one of the organisers. In collaboration with Heriot-Watt University Student Association (HWUMSA) and Heriot-Watt University Counselling & Disability Support, it participated in the Global Wellbeing Week Conferences conducted by the Wellbeing Department of Heriot-Watt University Student Associations in 3 campuses (Edinburgh, Dubai and Malaysia).

The Malaysian Edition Global Wellbeing Week Conference, Taking Relationships to a New, Healthy Norm, was also in line with the IEM Health & Wellness Series organised by IEM YES HQ themed Rejuvenate, Revitalise & Live Well! IEM-HWUM Student Section organised the conference with the help of HWUMSA and IEM YES HQ.

The event took place on 12 October 2021 with 185 participants across the globe. Dr Ingo Tophoven, whose research interest is geared towards all issues pertaining to global mental health, was invited as the honourable speaker. He also holds an MA degree in counselling psychology and a PhD in counsellor education and supervision.

This conference was aimed at reflecting on the management of our relationships and the ways we could improve our relationships by focusing on ourselves, families, peers and especially, on our significant other. Creating a healthy relationship is crucial to our mental health. It is important to identify relationship parameters and assumptions, the reasons behind relationship failures and ways to succeed in relationships to ensure a positive impact on our mental health.

Dr Tophoven delivered a clear message to all participants on how, what and why it is important to practise self-love in order to create healthy relationships. Staying connected with ourselves will help improve our own emotional wellbeing, allowing us to be more present for ourselves and our loved ones. We also learnt that conflicts are common in all relationships; in fact, it is inevitable. Having disagreements, misunderstandings and different expectations can be the cause of a failed relationship or a stronger relationship. Most people tend to focus on the arguments/fights with their loved ones, which results in losing them in return. From here, it is clear that having conflicts is not the problem but rather, the question is how we handle the conflicts.

Practising healthy communication skills is crucial to resolving conflicts with our loved ones. Healthy communication skills include being open-minded and trying our best to understand the other person's feelings first before proceeding to find a solution or compromise.

- 4. IEM Healthy and Wellness Series EP 1: Taking Relationship to a New, Healthy Norm.
- 5. Dr Tophoven
- 6. Relationships management and ways on how we can improve our relationships, focusing on ourselves, families, peers and especially, on our significant others.
- 7. Importance of creating a healthy relationship.

16 - 19 **MAR 2022** 10AM - 6PM

Concurrent Exhibition:

KUALA LUMPUR CONVENTION CENTRE, MALAYSIA

MALAYSIA'S 1ST **ENGINEERING AND ACMV&R EXHIBITION & CONFERENCE**

Be the first to experience the future of engineering focusing on latest technologies, sustainability, renewable energy, air quality and more!

116 hours of **new** experience & business opportunities

88 local & international speakers

62 hours of learning

power talks & industry sharing

symposiums by IEM

industry networking sessions

EXHIBITION DATE

16 & 17 MARCH 2022, WEDNESDAY & THURSDAY

18 & 19 MARCH 2022, FRIDAY & SATURDAY

10AM - 6PM: TRADE DAYS

TIME

10AM - 6PM: TRADE, PUBLIC & STUDENT DAYS THIS TRADE EXHIBITION IS OPEN TO PERSON/S ABOVE 16 YEARS OLD AND UPON REGISTRATION ONLY. Visitors must be in proper business attire and the Organisers reserve the rights to refuse entry to any person/s at their discretion.

4 days of Power Packed Events for the Engineering and ACMV&R Industry

Is Your Building Design BIM-Ready?

An unstoppable trend is brewing: the BIM adoption in architectural design and project management for greater design clarity, better foresight, and accuracy. It may soon become part of the design or regulatory compliance requirements too.

Be ahead of this paradigm shift with Lysaght BIM objects, download Lysaght BIM objects for free today:

Single-layer metal cladding BIM objects

Performance-driven built-up systems With essential flashing and capping detailing Revit model without Lysaght BIM object

Tarikh: 9 Februari 2022

111321 PHUA SEH YONG

Kepada Semua Ahli,

SENARAI CALON-CALON YANG LAYAK MENDUDUKI TEMUDUGA PROFESIONAL TAHUN 2022

Berikut adalah senarai calon yang layak untuk menduduki Temuduga Profesional bagi tahun 2022.

Mengikut Undang-Undang Kecil IEM, Seksyen 3.8, nama-nama seperti tersenarai berikut diterbitkan sebagai calon-calon yang layak untuk menjadi Ahli Institusi, dengan syarat bahawa mereka lulus Temuduga Profesional tahun 2022.

Sekiranya terdapat Ahli Korporat yang mempunyai bantahan terhadap mana-mana calon yang didapati tidak sesuai untuk menduduki Temuduga Profesional, surat bantahan boleh dikemukakan kepada Setiausaha Kehormat, IEM. Surat bantahan hendaklah dikemukakan sebulan dari tarikh penerbitan dikeluarkan.

Ir. Dr David Chuah Joon Huang

Setiausaha Kehormat, IEM

102265 LOW TSU JIN, KURTWIN

Pengumuman yang ke-160

SENARAI PENDERMA KEPADA WISMA DANA BANGUNAN IEM

Institusi mengucapkan terima kasih kepada semua yang telah memberikan sumbangan kepada tabung Bangunan Wisma IEM. Ahli-ahli IEM dan pembaca yang ingin memberikan sumbangan boleh berbuat demikian dengan memuat turun borang di laman web IEM http://www.iem.org.my atau menghubungi secretariat di +603-7968 4001 / 5518 untuk maklumat lanjut. Senarai penyumbang untuk bulan Januari 2022 adalah seperti jadual di bawah:

NO.	NO. AHLI	NAMA	
1	11572	Ir. ABD. MUTHALIB BIN ABD. RAHMAN	
2	09988	MR. KOSHY NAINAN A/L T. K. NAINAN	
3	38039	MR. GOH KHENG WEE
